

Dust collector

Important information

The dust collector is designed to collect the dust generated when drilling in a dry environment. It is suitable for drills that use bits with diameters of 4-10 mm.

The dust collector is designed for use in private homes and is not suitable for commercial purposes.

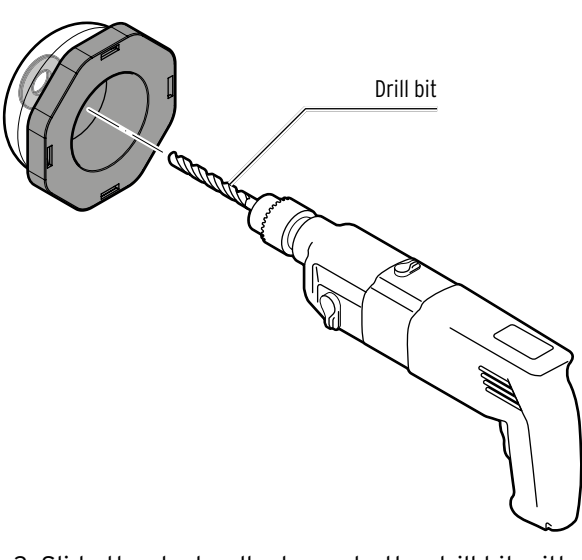

The dust collector contains a small part; swallowing it can be fatal. Therefore, keep the dust collector out of the reach of children.

Make sure that no power supply lines or pipes in the wall or ceiling are damaged when drilling.

Be careful when drilling and make sure that the drill does not slide out of place. There is a risk of injury!

Use

1. Clamp a suitable drill bit into the drill.
2. Mark the point on the wall where you want to drill.

3. Slide the dust collector onto the drill bit with the recess pointing toward the drill.
4. Position the drill bit on the marked point such that the drill is perpendicular to the wall.
5. Push the dust collector forwards so that the dome of the dust collector lies against the wall.
6. Hold the dust collector in this position so that it cannot slide out of place.
7. Drill the hole. Hold the drill straight so that the drill bit and dust collector do not touch each other.
8. Continue to hold the dust collector in position and carefully pull the drill out of the hole and the dust collector.

The round brush insert in the bottom part of the dust collector brushes the dust off the drill bit.

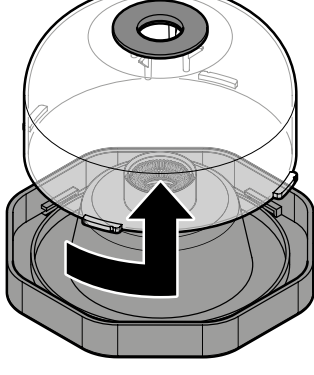

9. Remove the dust collector from the wall. Continue to hold it perpendicular to the wall so that no dust can spill out of the openings.

Emptying / cleaning the dust collector

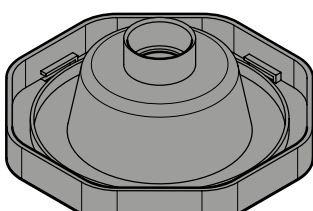

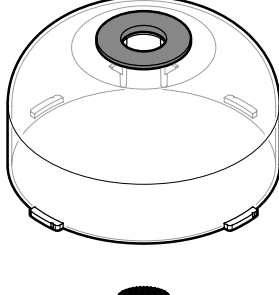

- ▷ Empty the dust collector after each use and clean it at regular intervals.

Emptying

1. Hold the dust collector over a waste bin.

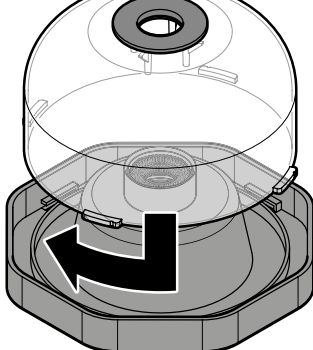

2. Turn the dome anti-clockwise and remove it.
3. Tip the dust from the dome and the lid into the waste bin and tap out the dome and lid.

Cleaning

- ▷ For thorough cleaning, remove the round brush insert from the opening in the bottom part of the dust collector and blow out the drilling dust or brush it off with a suitable brush. To reinsert it, press the brush insert together slightly if necessary and push it back into the opening.

- ▷ You can wash all of the parts with warm water and a mild cleaning product. Allow all parts to dry completely before reassembling them.

4. Replace the dome and turn it clockwise to close the dust collector again.
